

Save Green While Going Green

Four Reasons to Replace Your Heating System with a Heating and Cooling Heat Pump System

Are you interested in purchasing a new home heating system or upgrading your current one?

There are a lot of different home heating options—so, here are four reasons to choose a heating and cooling heat pump system.

Electrify Your Home Heating with a Heat Pump System

Reason 1

Cut Your Carbon Footprint

Heating and cooling heat pump systems are the cleanest option for home heating. On average, they produce:

- **2.7x** fewer greenhouse gas (GHG) emissions than standard electric
- **2.8x** fewer GHG emissions than natural gas
- **3x** fewer GHG emissions than propane
- **3.6x** fewer GHG emissions than oil

Reason 2

Efficiency

Heat pumps work by moving existing heat instead of generating it, which cuts down the overall energy usage.

- Heat pumps typically use **50%** less energy than traditional heating systems such as furnaces.
- Heat pumps allow homeowners to section their houses into zones with separate thermostats which allows them to control one zone at a time.

Reason 3

Savings and Heat Pump Resources

Customers of West Boylston Municipal Light Plant are eligible for a free Air Source Heat Pump Assessment through the NextZero Program.

- Heat pump experts evaluate their home and determine whether or not a heat pump would be a good fit.
- If the customer decides to purchase a heat pump, they are eligible for a **\$250 to \$500** rebate.

Reason 4

Save on Your Heating Bill

Annual Heating Costs

*Costs based on 750 kWh per month at a rate of \$.13 per unit for electric, \$2.38 per unit for natural gas, \$4.00 per unit for oil, and \$3.81 per unit for propane. Prices are from 3/3/22.
